

How do I redirect a subdomain to a subdirectory?

When the requests are redirected using an ASP file, the URL in browser for redirected domains will show the correct domain name and the directory name where the request is being redirected. You can also redirect the requests to a specific file.

For example :

http://subdomain1.YourHostedDomainName.com redirect to
http://subdomain1.YourHostedDomainName.com/subdomain1

http://subdomain2.YourHostedDomainName.com redirect to
http://subdomain2.YourHostedDomainName.com/subdomain2

The following is a sample script that you can use to redirect a subdomain. You will need to place it as default document on your document root.

```
<%  
If InStr( UCase(Request.ServerVariables("SERVER_NAME")),  
UCase("subdomain1.YourHostedDomainName.com") ) > 0 Then  
Response.Redirect("/subdomain1")  
Elseif  
    InStr( UCase(Request.ServerVariables("SERVER_NAME")),  
UCase("subdomain2.YourHostedDomainName.com") ) > 0 Then  
Response.Redirect("/subdomain2")  
Elseif  
    InStr( UCase(Request.ServerVariables("SERVER_NAME")),  
UCase("subdomain3.YourHostedDomainName.com") ) > 0 Then  
Response.Redirect("/subdomain3/home.asp")  
End If  
%>
```

NOTE:

1. Replace subdomain#.YourHostedDomainName.com with your actual subdomain URL.
2. Replace /subdomain# with your actual subdirectory name
3. In the last redirection statement in the example, we show how to redirect to a specific file
