You can publish your website to our server in few different ways.

1. Via FTP

Download FTP Client such as WSFTP, Cute FTP, FileZilla and SmartFTP. We recommend you to use SmartFTP and you can download it from www.smartftp.com. Fill in all the information such as the hostname, username and password and press connect to connect to our FTP server.

Once connected, you should be able to see your domain name folder. Click on the folder and browse until you find httpdocs folder. Upload all your website files into httpdocs folder. After finished uploading, you can test your site directly by open the URL in web browser

Alternatively, you can download the free FileZilla tool from <http://filezilla-project.org/download.php>

2. Via FrontPage

To upload your site via FrontPage, you need to have tools that support FrontPage Extension capability. Few of the tools that support FrontPage is Visual Studio, Microsoft FrontPage , Macromedia Dreamweaver.

First step that you need to do before transferring your site using FrontPage is you need to enable FrontPage Extension for your website. You can do this by going to your Control Panel -> Click on your Domain -> Setup -> Front Page Extension.

Once this is completed, open the authoring tools/software and start publishing your site. Please note that Microsoft FrontPage is not supported on Windows Server 2008 or above.

3. Via WebDeploy

WebDeploy is a new deployment tool developed by Microsoft and it simplifies the migration, management and deployment of IIS Web servers, Web applications and Web sites. In order to deploy your site with WebDeploy, please refer to the article [here](#).
